Procedure	Ordering Physician	Accession Number	Exam Date/Time
US Renal Retroperitoneal Sonography	BAUMAN, KAY	US-05-0002537	04/08/05 15:30:00

REASON

KIDNEY STONES

US read

RENAL ULTRASOUND

Sonographic examination of the kidneys was performed.

No prior examination is available for comparison at this time.

There is an approximately 9 mm shadowing echogenic focus in the lower pole of the right kidney consistent with renal calculus. No other definite renal calculi are identified. There is no evidence of significant hydronephrosis or perinephric fluid collections. The kidneys are otherwise unremarkable on appearance. The right kidney measures approximately 11.8 cm in length. The left kidney also measures approximately 11.8 cm in length. Evaluation of the urinary bladder with color Doppler demonstrates presence of bilateral ureteral flow jets. The distended bladder is grossly unremarkable on appearance.

US impression

Approximately 9 mm calculus in the lower pole of the right kidney with no evidence of significant hydronephrosis. Otherwise essentially unremarkable examination as described above.

Patient: Star Aholelei

Date of birth:

Current date: July 27, 2005

To make concern,

I will no longer be seeing patients from the Halawa Correctional Facility and would suggest referring the patient to the Queen Emma clinic for further treatment and evaluation. Mr. Aholelei's ultrasound demonstrates a 9 mm non-obstructing stone in the lower pole of the right kidney. CT scan from last year demonstrated a 6 mm stone in the same location. Though these are different imaging modalities there does appear to be a slight increase in size of the stone over the past year. Previous stones have been both calcium oxalate and uric acid. I would suggest obtaining a KUB. If the stone is not visible this would suggest that the stone is uric acid in composition and should be able to be dissolved with alkali therapy using either sodium bicarbonate or Uroocit-K. If the stone contains calcium i.e. is visible on plain KUB, I would consider ESWL.

Sincerely,

David A. Kuchenbecker MD

CT KIDNEY STONE W/O 23584085
Diagnosis:
s/p lithotripsy, r/u stones

Report dictated on 12/27/05

CT ABDOMEN AND PELVIS

DATE: 12/27/05

CLINICAL HISTORY: Abdominal pain, suspect renal lithiasis.

TECHNIQUE:

CT scan of the abdomen was performed without oral and intravenous administration of contrast material utilizing contiguous, 5 mm scan slices with 50% overlap to evaluate for renal or ureteral calcifications.

FINDINGS:

ABDOMEN CT:

Compared to a previous examination dated 10/17/02, there has been slight interval growth in one of the multiple stones in the right kidney from 5.0-6.6 cm in maximum diameter. This is located in a lower pole calyx. A second lower pole calculus has increased from 2-3 mm in diameter, and there has been interval development of a third, less than 2 mm calculus in the mid pole calyx. An upper pole 4.7 mm calculus is no longer present.

Multiple calculi present in upper and lower pole calices on the left are no longer present and an obstructing left ureteral calculus has also resolved. Previous hydronephrosis has resolved, although the left kidney does appear somewhat smaller than the right and may be mildly atrophic.

CT KIDNEY STONE W/O 23584085

IMPRESSION:

1. MULTIPLE RIGHT RENAL CALCULI.
2. RESOLUTION OF MULTIPLE LEFT RENAL AND URETERAL CALCULI.

[592.0]

PELVIS CT:

The lower ureters are normal in caliber. There is no evidence of a bladder calculus. The remainder of the pelvis is unremarkable except for tiny calcified appendicoliths present in an otherwise normal appearing appendix.

IMPRESSION:

NO EVIDENCE OF DISTAL URETERAL CALCULI.
